1 local response normalisation은 normalisation layers없이는 의미가 없다

2 ConvNet depth에 따라 성능이 좋아진다

근데 1x1 세 번보다 3x3 하나가 더 낫다

nonlinearity도 좋지만 spatial context by using conv도 중요

19 이상은 한계인 것 같지만 even deeper models might be beneficial for larger datasets

a deep net with small filters outperforms a shallow net with larger filters.

3 scale jittering at training time이 좋다

Multi Scale Evaluation

scale jittering at test time leads to better performance

Configuration

Table 1: **ConvNet configurations** (shown in columns). The depth of the configurations increases from the left (A) to the right (E), as more layers are added (the added layers are shown in bold). The convolutional layer parameters are denoted as "conv(receptive field size)-(number of channels)". The ReLU activation function is not shown for brevity.

Discussion

3×3

왜 7×7 안 쓰냐?

1 three non-linearities

2 decrease the number of parameters

Classification Framework

Training

Krizhevsky랑 똑같은

the nets required less epochs to converge

(a) implicit regularisation imposed by greater depth and smaller conv. filter sizes; (b) pre-initialisation of certain layers.

The initialisation of the network weights is important

224 224 구현기

random crop

random horizontal flipping and random RGB colour shift

Smallest side

1 Fix S

2 random S in range

Testing

isotropically rescaled

Finally, to obtain a fixed-size vector of class scores for the image, the class score map is spatially averaged (sum-pooled).

We also augment the test set by horizontal flipping of the images;

the soft-max class posteriors of the original and flipped images are averaged to obtain the final scores for the image.
